Sea a shell for the smart &
user-friendly command line

Florian Pichler – @pichfl

A little history

The Shell is a user interface.

The UNIX-Shell is *the* user interface.

Shells are command-line interpreters:

Run scripts.

Find stuff.

Use anything on your computer.

First, there was *sh*.
Created by Ken Thompson from 1971 to 1975. (Seriously)
Recreated by Stephen Bourne around 1979.

Also, csh - the C shell 1978

Then, bash - The Bourne Again Shell 1989

At last, Z shell - 1990

FISH

Friendly Interactive Shell

Finally, a command line shell for the 90s

Started in 2005

What?

fish is a smart and user-friendly command line shell for macOS, Linux, and the rest of the family.

- Autosuggestions
- Glorious VGA Color
- Sane Scripting
- Web Based configuration
- Man Page Completions
- Plugins

Easy to install, maintain and use.

brew install fish

Follow the instructions. Thats it.

Learn more at https://fishshell.com

But... I like a package manager to manage plugins I create or find on the internet™

Consider fisherman
https://github.com/fisherman/fisherman

DEMO!

A few more things

Don’t use grep. Use ripgrep.
https://github.com/BurntSushi/ripgrep

Use thefuck.
https://github.com/nvbn/thefuck

Find more awesome stuff about fish.
https://github.com/JorgeBucaran/awesome-fish

Thanks.
